SUMMARY

Computer Technology graduate (Cum Laude) and automation engineer who ships production backend, automation, and web application systems end to end, from REST API contracts and webhooks to access-control logic and CRM data architecture. Builds live integrations across GoHighLevel, n8n, Asana, and Supabase with JavaScript, Python, and SQL, turning business requirements into maintainable systems.

EDUCATION

CEBU TECHNOLOGICAL UNIVERSITY, GINATILAN CAMPUS

BIT, Major in Computer Technology, Cum Laude

Ginatilan, Cebu

May 2026

Relevant Coursework: Programming, Computer Networks and Security, Microprocessor Systems, Embedded Systems, Digital Electronics

WORK EXPERIENCE

BAI FINANCE GROUP OF COMPANIES

Cebu, Philippines

Automation & Systems Integration Engineer

May 2026 to September 2026

- Architected a scalable, version-controlled automation platform on self-hosted n8n (191 workflows across 19 pipelines, 64 users), designing webhook endpoints and REST payload contracts to integrate GoHighLevel (GHL) and Asana, migrating off a legacy Google Apps Script setup.
- Built bidirectional GHL-Asana synchronization on the GHL v2 API, auto-creating tasks from new opportunities and mapping 30+ pipeline stages; engineered an authoritative-state check that eliminated a bidirectional echo loop responsible for duplicate updates.
- Designed automated broker assignment with a follower-based access-control model: routing each new client to the correct broker by originating BDA, sending email notifications, and enforcing per-broker data confidentiality under restricted-visibility settings.
- Shipped a production QR business-card lead-capture flow in n8n that upserts scanned prospects into GHL, assigns the owning broker via a routing guard, and sends a welcome email through a verified sender with per-broker Reply-To routing to preserve SPF/DKIM/DMARC alignment.
- Engineered a contact-validation workflow flagging new, existing, and duplicate records; audited 4,000+ CRM contacts and delivered a phased data-cleanup roadmap and a company-wide Contact Management SOP.
- Shipped the company's Next.js marketing site and Supabase-backed admin CMS with middleware role gating, rate limiting, and CSP headers; Vitest and Playwright suites hold 90% coverage on the lead-capture and calculator paths.
- Built and QA-owned BaiAcademy, an internal learning platform (Next.js, Supabase, Railway) with role-based access control and Jitsi live sessions; triaged a P0–P2 defect backlog and designed its GHL enrollment integration.
- Lead a six-person engineering team: assign workflow builds, review n8n JSON deliverables, own documentation standards, and authored the six-part internal automation training series they onboard through.

CONFIDENTIAL CLIENT - ECOMMERCE PLATFORM

Remote

Technical Operations Engineer (Agency Contract)

June 2026 to September 2026

- Sole engineer owning end-to-end technical operations for an affiliate-management ecommerce platform: uptime monitoring, GitHub Issues bug triage, and minor React/TypeScript feature development under a tiered P1–P3 SLA.
- Audited production endpoints and removed an unauthenticated service-role function that bypassed row-level security on the live database, closing a path that let users write their own commission records.
- Root-caused an analytics endpoint that had never returned real data — a scoping error swallowed by a fail-open catch into a valid HTTP 200 — and rebuilt it to fail closed, flagging a deploy-order hazard that would have locked out every user.
- Maintain the production Supabase/PostgreSQL backend with automated backups, integrity checks, and schema migrations, and sustain live n8n automation workflows and third-party webhook integrations.
- Own security patching and incident response with breach notification inside 24 hours, driving P1–P3 triage and direct client communication over Discord and WhatsApp.

CEBUANO SPEECH-TO-TEXT CAPSTONE PROJECT

Ginatilan, Cebu

Undergraduate Researcher

June 2025 to May 2026

- Engineered a Cebuano ASR pipeline in Python (Hugging Face Transformers, Wav2Vec2-XLSR, KenLM), independently training and decoding models that achieved 3.07% WER and 1.03% CER on 552 test samples.
- Built a reproducible speech-data pipeline preprocessing and splitting 3,622 utterances into speaker-disjoint train, validation, and test sets, and authored a conference paper on the results.

LEADERSHIP EXPERIENCE

SUPREME STUDENT GOVERNMENT

Ginatilan, Cebu

Vice President

August 2023 - May 2024

- Elected Vice President of the student body, leading 20+ officer teams and representing students to administration.

SKILLS

Programming: JavaScript, TypeScript, Python, C, SQL

Backend, Frontend & APIs: Node.js, Next.js, React, Django, FastAPI, REST APIs, Webhooks, Prisma, Supabase, PostgreSQL

Automation & Integration: n8n, GoHighLevel (GHL), Asana API, LearnWorlds API, Zapier, Google Apps Script

AI Integration: Gemini API, Hugging Face Transformers, Wav2Vec2-XLSR, KenLM

Tools & Platforms: Git, GitHub, Docker, Linux, Cloudflare Tunnel, Google Cloud Console, Railway, Jitsi, Shopify
