SUMMARY

Full-stack and automations developer who leads custom business systems from requirements and system design to role-gated web apps, integrations, monitoring and handover. Has delivered for ecommerce, finance and brokerage businesses in Australia, the Philippines and internationally with TypeScript, Python and SQL.

EDUCATION

CEBU TECHNOLOGICAL UNIVERSITY, GINATILAN CAMPUS — Ginatilan, Cebu

BIT, Major in Computer Technology, Candidate for Cum Laude — *Expected May 2027*

Relevant Coursework: Programming, Computer Networks and Security, Microprocessor Systems, Embedded Systems, Digital Electronics

WORK EXPERIENCE

BAI GROUP OF COMPANIES — Cebu, Philippines

Full-Stack & Automations Developer (Intern) — *May 2026 to January 2027*

- Technical lead for two project teams and one solo build across a 1,800-hour internship: gather requirements from stakeholders, analyze use cases, design each system around its users, and direct a six-person engineering team through delivery.
- Led the team building Jim's Franchise Loan, a custom loan CRM in Next.js and Supabase that replaced a spreadsheet: 10 synced pipeline stages, a servicing calculator, row-level permissions, audit history, and 624 automated tests.
- Led the team building Company Radar, a custom sales CRM with AI prospecting for Bai Philippines: a weekly Python pipeline that collects, classifies and scores job-ad leads, behind a FastAPI dashboard with quota and AI spend controls.
- Sole developer of the contractor Leave Application Platform on n8n: emailed one-time codes, live leave credits, half days, and supervisor approval by email through a confirmation step that mail scanners cannot trigger.
- Architected a version-controlled automation platform on self-hosted n8n (191 workflows, 19 pipelines, 64 users): two-way GHL-Asana sync across 30+ stages, an authoritative-state check that ended duplicate updates, and confidential broker routing.
- Instrumented n8n with production monitoring: instant Discord failure alerts throttled per workflow, an hourly heartbeat whose absence signals an outage, and three-tier backups including a nightly off-box export of every workflow.
- Built the CRM sync and inquiry pipeline behind the company website as a reviewed Supabase Edge Function: tiered contact de-duplication, exactly-once close and transcript claims, on a CI-enforced 90% coverage floor.
- Contributed to BaiAcademy, a team-built LMS (Django REST, Next.js, PostgreSQL): built its audit and access-logging subsystem with retention windows, hardened the production deployment, and shipped the broker/BDA referral-code flow.
- Authored the six-part automation training series the engineering team onboards through.

FREELANCE - CONFIDENTIAL CLIENTS — Remote

Software Engineer (Agency & Contract) — *June 2026 to Present*

- Took over a partly built affiliate-rewards ecommerce platform as sole engineer: learned its stack from the docs, stripped dead code and unused endpoints, then owned delivery from requirements through release and handover.
- Built the finance and payout system: transaction ledger, database-driven rate card, refund holdback, oldest-first payout ledger, and AES-256-GCM encrypted bank details, across 17 Supabase Edge Functions and 28 PostgreSQL migrations.
- Delivered 10 of 11 client requirements, shipped 25 server functions in one browser-verified release, removed an unauthenticated service-role function, and identified and fixed an admin self-escalation path.
- Wrote a daily end-to-end production health check, split dev from prod with a PII-scrubbing clone, and closed the contract with a re-verified handover, runbooks and scripts.
- Build internal tools and job-market scrapers for Australian finance and brokerage clients, replacing manual searching and spreadsheet work with automated pipelines and dashboards.
- Built n8n automation tools, including an open-source RAG Gmail assistant (Qdrant, Gemini) that answers from a company's own documents, drafts every reply for human review, and escalates what it cannot answer.

CEBUANO SPEECH AI — Ginatilan, Cebu

Backend Developer — *June 2025 to Present*

- Built a Cebuano ASR model in Python (Hugging Face Transformers, Wav2Vec2-XLSR, KenLM), independently training and decoding models; reached 4.15% WER and 1.16% CER on 552 held-out samples with beam search alone.
- Built the Django labeling app behind its 3,622-utterance dataset and authored a conference paper on the results. Now building a Cebuano AI voice agent on the model: voice detection, speaker gate, ASR, then an LLM reply.

LEADERSHIP EXPERIENCE

SUPREME STUDENT GOVERNMENT — Ginatilan, Cebu

Vice President — *August 2023 - May 2024*

- Elected Vice President of the student body, leading 20+ officer teams and representing students to administration.

SKILLS

Programming: JavaScript, TypeScript, Python, C, SQL
Full-Stack & APIs: Next.js, React, Node.js, FastAPI, Django, REST APIs, Webhooks, Prisma, Supabase, PostgreSQL
Automation & Integration: n8n, GoHighLevel (GHL), Asana API, LearnWorlds API, Zapier, Google Apps Script
AI Integration: Claude API, Gemini API, Groq, Hugging Face Transformers, Wav2Vec2-XLSR, KenLM
Tools & Platforms: Git, GitHub, GitHub Actions, Docker, Linux, Cloudflare Tunnel, Google Cloud Console, Railway, Jitsi, Shopify
