SUMMARY

Computer Technology graduate (Cum Laude) and automation engineer who ships production backend, automation, and web application systems end to end, from schema and REST API contracts to role-gated dashboards, monitoring, and handoff. Builds live integrations across GoHighLevel, n8n, Asana, and Supabase with JavaScript, TypeScript, Python, and SQL, turning business requirements into maintainable systems.

EDUCATION

CEBU TECHNOLOGICAL UNIVERSITY, GINATILAN CAMPUS

BIT, Major in Computer Technology, Cum Laude

Ginatilan, Cebu

May 2026

Relevant Coursework: Programming, Computer Networks and Security, Microprocessor Systems, Embedded Systems, Digital Electronics

WORK EXPERIENCE

BAI FINANCE GROUP OF COMPANIES

Automation & Systems Integration Engineer

Cebu, Philippines

May 2026 to September 2026

- Architected a scalable, version-controlled automation platform on self-hosted n8n (191 workflows across 19 pipelines, 64 users), designing webhook endpoints and REST payload contracts to integrate GoHighLevel (GHL) and Asana, migrating off a legacy Google Apps Script setup.
- Built bidirectional GHL-Asana sync on the GHL v2 API mapping 30+ pipeline stages to tasks, with an authoritative-state check that ended a duplicate-update echo loop and follower-based broker routing enforcing per-broker confidentiality.
- Instrumented n8n with production monitoring: instant Discord failure alerts throttled per workflow, an hourly heartbeat whose absence signals an outage, and three-tier backups including a nightly off-box GitHub Actions export of every workflow.
- Shipped a production QR business-card lead-capture flow in n8n that upserts scanned prospects into GHL, assigns the owning broker via a routing guard, and sends a welcome email through a verified sender with per-broker Reply-To routing to preserve SPF/DKIM/DMARC alignment.
- Engineered a contact-validation workflow flagging new, existing, and duplicate records; audited 4,000+ CRM contacts, delivered a cleanup roadmap and Contact Management SOP, and designed a weekly digest of untagged, unowned, and needs-review contacts.
- Built the CRM sync and inquiry pipeline behind the company website as a reviewed Supabase Edge Function: tiered contact de-duplication, exactly-once close and transcript claims, and the indexes beneath them, on a CI-enforced 90% coverage floor.
- Contributed to BaiAcademy, a team-built LMS (Django REST, Next.js, PostgreSQL): built its audit and access-logging subsystem with retention windows, hardened the production deployment, and shipped the broker/BDA referral-code flow end to end.
- Lead a six-person engineering team: assign workflow builds, review n8n JSON deliverables, own documentation standards, and authored the six-part internal automation training series they onboard through.

CONFIDENTIAL CLIENT - ECOMMERCE PLATFORM

Software Engineer (Agency Contract)

Remote

June 2026 to September 2026

- Took over a partly built affiliate-rewards ecommerce platform as sole engineer: learned its stack and architecture from the docs, stripped dead code and unused endpoints, then owned delivery from requirements through release and handoff.
- Built the finance and payout system: transaction ledger, database-driven rate card, refund holdback, oldest-first payout ledger, and AES-256-GCM encrypted bank details, across 17 new Supabase Edge Functions and 28 PostgreSQL migrations.
- Delivered 10 of 11 Finance and Marketing requirements and shipped 25 server functions to production in a single browser-verified release, and made the commission basis, previously three conflicting figures, explicit in every export.
- Removed an unauthenticated service-role function that let users write their own commission records, identified and fixed an admin self-escalation path, and root-caused an analytics endpoint that failed open into a valid HTTP 200, rebuilding it to fail closed.
- Wrote a daily end-to-end production health check (real signup and login, every server function, every workflow's failures), split dev from prod with a PII-scrubbing clone, and closed the contract with a re-verified handoff, runbooks, and scripts.

CEBUANO SPEECH-TO-TEXT CAPSTONE PROJECT

Undergraduate Researcher

Ginatilan, Cebu

June 2025 to May 2026

- Engineered a Cebuano ASR pipeline in Python (Hugging Face Transformers, Wav2Vec2-XLSR, KenLM), independently training and decoding models; reached 4.15% WER and 1.16% CER on 552 held-out samples with beam search alone.
- Built a reproducible speech-data pipeline preprocessing and splitting 3,622 utterances into speaker-disjoint train, validation, and test sets, and authored a conference paper on the results.

LEADERSHIP EXPERIENCE

SUPREME STUDENT GOVERNMENT

Vice President

Ginatilan, Cebu

August 2023 - May 2024

- Elected Vice President of the student body, leading 20+ officer teams and representing students to administration.

SKILLS

Programming: JavaScript, TypeScript, Python, C, SQL

Backend, Frontend & APIs: Node.js, Next.js, React, Django, FastAPI, REST APIs, Webhooks, Prisma, Supabase, PostgreSQL

Automation & Integration: n8n, GoHighLevel (GHL), Asana API, LearnWorlds API, Zapier, Google Apps Script

AI Integration: Gemini API, Hugging Face Transformers, Wav2Vec2-XLSR, KenLM

Tools & Platforms: Git, GitHub, GitHub Actions, Docker, Linux, Cloudflare Tunnel, Google Cloud Console, Railway, Jitsi, Shopify
